Abstract. The list of the species of *Hoya* R.Br. occurring on the Indonesian island of Sumatra is updated and the type citation is clarified. Sixteen taxa are added to the latest checklist. *Hoya danumensis* subsp. *amarii* S.Rahayu & Rodda subsp. nov., *H. rigidifolia* S.Rahayu & Rodda sp. nov., *H. solokensis* S.Rahayu & Rodda sp. nov., and *H. sumatrana* S.Rahayu & Rodda sp. nov. are newly described. *Hoya parviflora* Wight, *H. parvifolia* Schltr., and *H. purpureofusca* Hook. are lectotypified.

Keywords. Apocynaceae, Asclepiadaceae, Asclepiadoideae, Indonesia, Marsdenieae.

Rahayu S. & Rodda M. 2019. *Hoya* of Sumatra, an updated checklist, three new species, and a new subspecies. *European Journal of Taxonomy* 508: 1–23. <https://doi.org/10.5852/ejt.2019.508>

Introduction

Indonesia has been predicted to have the most diverse array of species of *Hoya* R.Br (Brown 1810; Kleijn & van Donkelaar 2001). However, a full inventory of *Hoya* occurring in Indonesia is yet to be completed. Indonesia is an extremely large and diverse country and our plan is to complete an inventory and revision of the Indonesian *Hoya* working on seven separate geographical areas: Sumatra, Java, Kalimantan, Lesser Sunda Islands, Sulawesi, Maluku, and Indonesian New Guinea.

Recent papers on Indonesian *Hoya* were published by Kleijn & van Donkelaar (2001), who revised the genus in central Sulawesi, where 13 species occur; by Rahayu & Wanntorp (2012), who published a checklist and a key to the *Hoya* of Sumatra that included 27 species; and lastly by Lamb & Rodda (2016), who published a checklist of the Bornean species including 72 species, 34 of which occurring in Kalimantan. The most recently published *Hoya* from Sumatra is *H. fauziana* subsp. *angulata* Rodda *et al.* (2018).

The present paper aims at updating the checklist and clarifying the type citation of all the taxa of *Hoya* from Sumatra. Three species and one new subspecies are newly published: *H. danumensis* subsp. *amarii* S.Rahayu & Rodda subsp. nov., *H. rigidifolia* S.Rahayu & Rodda sp. nov. (based on material identified by Rahayu & Wanntorp (2012) as *H. ob lanceolata* Hook.f.), *H. solokensis* S.Rahayu & Rodda sp. nov., and *H. sumatrana* S.Rahayu & Rodda sp. nov.

Material and methods

The present paper is based on the examination of specimens at B, BO, BM, K, and SING, as well as JSTOR Global Plants (<https://plants.jstor.org/>, accessed on 24 Jul. 2018) and on field-collected plants cultivated at the Bogor Botanic Gardens. All names have been verified on International Plant Names Index (<http://www.ipni.org/>, accessed on 24 Jul. 2018) and TROPICOS (<http://www.tropicos.org/>, accessed on 24 Jul. 2018). All protogues and type citations have been verified on Biodiversity Heritage Library (<https://www.biodiversitylibrary.org/>, accessed on 24 Jul. 2018), JSTOR (<https://www.jstor.org/>, accessed on 24 Jul. 2018) or at the Singapore Botanic Gardens library. Heterotypic synonyms are indicated only when based on types from Sumatra. All acronyms for repositories follow Thiers (2019).

Figs 1A–B, 2A–B

Etymology

The new species is named after Amar Husein Sitompul, who collected the type specimen.

Type material

Holotype

INDONESIA • Sumatra, North Sumatra, Padang Sidempuan; ca 900 m a.s.l.; 16 Sep. 2014; Amar Husein Sitompul s.n. leg.; BO.

Description

Epiphytic shrub, with white latex in all vegetative parts. Roots only basal, no adventitious roots observed. Stems erect or spreading, 4–6 mm in diameter, bright green, sparsely pubescent when young; older stems grey, glabrous; internodes 2–4(6) cm. Leaf blades 5–12 × 2.5–5 cm, thin, not succulent, chartaceous when dry, broadly lanceolate to oblong, base rounded, apex acuminate or caudate, mid green on adaxial surface, pale green on abaxial surface, glabrous (sparsely pubescent when young), venation pinnate, midrib slightly depressed on adaxial surface, convex on abaxial surface, secondary veins 3–7 pairs, basal colleters absent; petioles 5–10 × 2–3 mm, terete, channelled above, twisted, mid green, sparsely pubescent when young, otherwise glabrous. Inflorescences sciadioidal, convex, of 5–15 flowers, with peduncles extra-axillary, positively geotropic, unbranched, one at each node, producing flowers subsequently a few times, terete, 10–15 × 1.5–2.5 mm, green, sparsely pubescent when very young. Flowers with terete pedicels 2.5–3 cm × 0.06–0.08 mm, pale green, glabrous. Calyx lobes triangular, apex round, 1.5–2 × 0.5–0.6 mm, sparsely pubescent outside or glabrous, inside glabrous, ciliate; basal colleters 0.15–0.25 × 0.15–0.2 mm, one at each calyx sinus, ovoid. Buds globose, 5-ridged, dark brown or deep purple when young, turning green. Corolla shallowly campanulate, 20–23 mm in diameter; tube 9–11 mm long, creamy white, glabrous outside, pilose inside, basally densely pubescent; lobes 2–3 × 11–12 mm, very broadly triangular, valvate in bud, creamy white, glabrous outside, very sparsely pubescent inside, tip glabrous. Corona staminal 4–5 mm high, 10–12 mm in diameter, stiff and waxy-looking, white; lobes 4.5–5 × 2.3–2.5 mm, spreading, ovate, attached at the back of the anthers, inner process apiculate, not touching in the middle, outer process acute with a rounded tip, lobes with revolute margin underneath. Anthers ca 0.7 × 0.5 mm, ovate, with apical round membranaceous appendage covering the style-head apex. Pollinia 550–650 × 220–270 µm, oblong, with a round base and an obliquely truncated apex; pellucid margin present all along the outer edge; caudicles ca 280 × 180 µm, broadly triangular, almost transparent; corpusculum 300–350 × 100–120 µm, oblong; style-head 5-angled in cross section, with five spreading lobes alternating with the stamens, style-head depressed with a central raised conical apex ca 0.5 × 0.5 mm broad at the base, apex rounded; ovary 1.4–1.6 mm high, 0.3–0.4 mm in diameter, narrowly conical, apex acute. Fruit and seed not observed.

Distribution and habitat

Hoya danumensis subsp. *amarii* subsp. nov. is only known from the type locality in northern Sumatra, Indonesia, ca 900 m a.s.l.

Conservation status

Known only from a single collection and lacking information on the distribution area, the population size and the possible threats to the habitat, *H. danumensis* subsp. *amarii* is considered as Data Deficient (DD) (IUCN 2012).

Photos: Amar Husein Sitompul (A), Fadly (C), S. Rahayu (E–F), and M. Rodda (B, D, G).

Notes

Hoya danumensis subsp. *amarii* subsp. nov. can be separated from *H. danumensis* Rodda & Nyhuus (2009) subsp. *danumensis* because of the shape and size of the corolla that is shallowly campanulate, 20–23 mm in diameter and deeply campanulate, vs 25–35 mm in the latter; in the shape and size of the corona lobes that are ovate-oblong and 5.5–6 × 2.4–2.6 mm in *H. danumensis* subsp. *danumensis* vs ovate and 4.5–5 × 2.3–2.5 mm in the new subspecies.

Figs 1E–F, 2E–G

Etymology

The new species is named for its rigid and stiff leaves.

Type material

Holotype

INDONESIA • Sumatra, western Sumatra, Mentawai Islands, Pulau Siberut; 100 m a.s.l.; Aug. 2014; S. Rahayu 865 leg.; voucherized from live collection at Bogor Botanic Garden on 26 Sep. 2016 as ‘S. Hidayat B9710110’; BO.

Description

Epiphytic climber, with white latex in all vegetative parts. Roots adventitious below the nodes and along the internodes. Stems climbing, 3–4 mm in diameter, dull brown, sparsely pubescent; older stems grey, glabrous; internodes 4–10 cm. Leaf blades 4–12(15) × 2.5–5 cm, stiff and succulent, lanceolate to oblong, base acute, apex apiculate, mid to pale green on adaxial surface with sparse grey spots, pale green on abaxial surface with darker lines corresponding with the main vein and two prominent secondary veins, glabrous or sparsely pubescent when young, venation pinnate but with two prominent secondary veins running along the entire length of the lamina, and with a further 3–10 small secondary veins each side, primary and secondary veins depressed on adaxial surface, flat on abaxial surface; basal colleter ca 1 × 1.5 mm, one at each lamina base, broadly triangular, pale brown/cream; petioles 7–25 × 4–6 mm, terete, thicker than stems, pale brown, sparsely pubescent when young. Inflorescences 3.5–4 cm in diameter, of 20–25 flowers, sciadioidal, convex; peduncles 15–30 × ca 3 mm, terete, extra-axillary, laterally held, one at each node, producing flowers over an extended period of time, brownish, sparsely pubescent. Flowers with terete pedicels 13–17 × 0.7–1 mm, pale brownish yellow, minutely papillose. Calyx lobes ovate or round, apex rounded, 1–1.5 × 0.8–1 mm, minutely papillose outside, glabrous inside, ciliate; basal colleters 250–300 × 120–150 µm, ovoid, one at each calyx sinus. Corolla rotate, 10–12 mm in diameter when flattened; tube ca 1.5 mm long, cream inside, pale brown outside, glabrous; lobes 3.3–3.7 × 2.4–2.8 mm, ovate, valvate in bud, with incurved acute tip, cream fading to pale brown at the tip inside, brown outside, glabrous. Corona staminal, 1.2–1.4 mm high, 3.7–4.2 mm in diameter, white; lobes 2–2.3 × 1.1–1.2 mm, attached at the back of the anthers, held at a ca 80° angle, ovoid, slightly carinate above, inner process acute, erect, outer process rounded, spreading, with a basal revolute margin. Anthers ca 0.7 × 0.6 mm, ovate, including a thin apical round membranaceous appendage. Pollinia 350–400 × 130–150 µm, oblong, with a round base and an obliquely truncate apex; with a pellucid margin along the outer edge; caudicles ca 40 × 20 µm, much reduced; corpusculum 120–140 × ca 50 µm, oblong; style-head 5-angled in cross section, with five spreading lobes alternating

with the stamens, style-head apex depressed with a central conical acute tip ca 200 µm high; ovary 0.8–0.9 mm high, ca 0.35 mm in diameter at the base, conical, lightly curved, apex acute. Fruit and seed not observed.

Distribution and habitat

Hoya rigidifolia sp. nov. is only known from the type locality in the lowland forest of Pulau Siberut, southern Sumatra, Indonesia.

Conservation status

Known only from a single collection and lacking information on the distribution area, the population size and the possible threats to the habitat, *H. rigidifolia* sp. nov. is considered as Data Deficient (DD) (IUCN 2012).

Notes

Hoya rigidifolia sp. nov. flowers only open for a single day. The flowers of *H. finlaysonii* are also open for a single day and have a similar flower morphology (rotate corolla, ovoid corona lobes of similar size). Both species are, however, easily separated based on leaf characters. *Hoya finlaysonii* has lanceolate to oblong leaves with pinnate venation, usually darker than the rest of the lamina; *H. rigidifolia* sp. nov. also has pinnate venation, but additionally it has two basal secondary veins running along the entire length of the lamina. The leaf venation of *H. erythrina* Rintz (1978) is similar to that of *H. rigidifolia* sp. nov.; however, both species can be separated based on flower characters: *H. erythrina* has flowers with corolla > 15 mm in diameter when flattened, long-pubescent inside, and lasting > 2 days, while *H. rigidifolia* sp. nov. has flowers with corolla < 12 mm in diameter when flattened, glabrous inside, and lasting one day.

Figs 1C–D, 2C–D

Etymology

The new species is named after the collection locality in Solok, Sumatra.

Holotype

INDONESIA • Sumatra, Solok; ca 1000 m a.s.l.; 10 Oct. 2016; Fadly s.n. leg.; BO.

Description

Epiphytic shrub, with white latex in all vegetative parts. Roots only basal, no adventitious roots observed. Stems erect or spreading, 2.5–5 mm in diameter, dull green, sparsely pubescent when young; older stems grey-brown, glabrous; internodes 1–2(5) cm. Leaf blades 5–10(12) × 2.5–4 cm, thin, not succulent, chartaceous when dry, elliptic, base and apex acute or acuminate, mid green on adaxial surface, pale green on abaxial surface, glabrous, venation pinnate, midrib slightly depressed on adaxial surface, convex on abaxial surface, with 4–7 pairs of secondary veins, basal colleters absent; petioles 5–10 × 1.7–2 mm, terete channeled above, mid green, sparsely pubescent. Inflorescences sciadioidal, convex, of 3–10 flowers; peduncles 8–12 × 1.2–1.4 mm, extra-axillary, positively geotropic or horizontal, unbranched, one at each node, producing flowers only once, terete, green, sparsely pubescent just below the rachis, otherwise glabrous. Flowers with terete pedicels 5–8 × 1–1.5 mm, pale green, sparsely pubescent. Calyx lobes ovate-round, apex round, 1.4–2.2 × 1.2–1.6 mm, light green, pubescent outside, glabrous inside, ciliate; basal colleters 1.5–2.3 × 1.3–1.5 mm, 1–3 at each calyx sinus, ovoid. Corolla tube basally bulbous, tightly enveloping the lower half of the corona, with a contracted throat, a short funnel-shaped tube and free, lanceolate, spreading lobes, white; basal bulbous part 2.5–3 mm high, 3–3.5 mm in diameter; free lobes 5–6 × 2.5–3 mm, narrowly triangular, valvate in bud, with recurved edges and tip, tube pubescent inside with retrorse hairs, sparsely pubescent outside with spreading hairs,

lobes sparsely pubescent inside and outside with spreading hairs. Corona staminal 4.5–5 mm high, 2.5–3 mm in diameter, stiff and waxy-looking, white; lobes 4.5–5 × 1–1.2 mm, erect, oblong and sinuose, attached at the back of the anthers, upper apicis rounded, touching in the middle, outer tips obtuse, with a narrow revolute margin. Anthers ca 0.5 × 0.3 mm, ovate, with apical round membranaceous appendage just covering the style-head apex. Pollinia 470–520 × 200–240 µm, oblong, with a round base and apex; pellucid margin missing; caudicles ca 130 × 70 µm, ovoid, almost transparent; corpusculum 300–320 × 160–180 µm, ovoid; style-head 5-angled in cross section, with five spreading lobes alternating with the stamens, style-head apex conical, 1–1.2 mm high, 0.9–1.1 mm in diameter at the base, apex acute; ovary 1.5–1.7 mm high, conical, with apex acute. Fruit and seed not observed.

Distribution and habitat

Hoya solokensis sp. nov. is only known from the type locality in Solok, Sumatra, Indonesia, at ca 1000 m a.s.l. It was collected in an evergreen forest, where it was growing epiphytically.

Conservation status

Known only from a single collection and lacking information on the distribution area, the population size and the possible threats to the habitat, *H. solokensis* sp. nov. is considered as Data Deficient (DD) (IUCN 2012).

Notes

Hoya solokensis sp. nov. is one of the few species of *Hoya* that exhibits a non-climbing habit but is instead an epiphytic shrub. It is morphologically similar to *H. papaschonii* Rodda (Rodda & Ercole 2014), a species only found in southern Thailand. Both species share a shrubby habit, short-lived peduncles, and flowers with a tubular corolla. However, *H. papaschonii* has the free part of the corolla lobes mostly held upright, while in *H. solokensis* sp. nov. the lobes are spreading; furthermore, the corona of *H. papaschonii* has both staminal and interstaminal elements while *H. solokensis* sp. nov. only has a staminal corona. Another species with a tubular corolla is *H. telosmoides* Omlor (1996) from Borneo, that is, however, a climber. The flowers of *H. solokensis* sp. nov. superficially resemble those of the Bornean *H. hamiltoniorum* A.L.Lamb, Gavrus, Emoi & Gokusing (Lamb *et al.* 2014) because both species have the free part of the corolla lobes spreading, however *H. hamiltoniorum* is a climber and its inner apex of the corona lobe is bifid, while the apex of the inner lobes of *H. solokensis* sp. nov. is entire.

Hoya sumatrana S.Rahayu & Rodda sp. nov.

Description

Epiphytic climber, with white or yellowish latex in all vegetative parts. Roots adventitious below the nodes and along the internodes. Stems 2–4 mm in diameter, climbing, dull green, pubescent; older stems grey, glabrescent; internodes 2–5(10) cm. Leaf blades 3–7(15) × 3.5–5.5 cm, stiff and succulent, oblong, ovate or elliptic, base round to attenuate, apex acute, mid green on adaxial surface with sparse grey spots, pale green on abaxial surface, glabrous, or very sparsely pubescent when young, venation pinnate, inconspicuous, basal colleters ca 1 × 1.5 mm, one at each lamina base, broadly triangular, pale brown; petioles 10–20 × 3–6 mm, terete, dark brown, sparsely pubescent when young. Inflorescences 2.5–3 cm in diameter, of 10–15 flowers, sciadioidal, flat; peduncles 15–35 × 1.5–2 mm, extra-axillary, positively geotropic, 1 at each node, producing flowers over an extended period of time, terete, dark red, sparsely pubescent. Flowers with terete pedicels 5–15 × 0.7–1 mm, dark red at the base, fading to pale pink towards the calyx, sparsely papillose. Calyx lobes narrowly triangular, spaced 0.6–0.8 mm apart, apex acute or rounded, 1.4–2 × 0.5–0.8 mm, reddish, papillose outside, inside glabrous, sparsely ciliate; basal collectors 0.16–0.18 × 0.09–0.11 mm, one at each calyx sinus, ovoid. Corolla 7–9 mm in diameter when flattened, rotate; tube ca 1.5 mm long, cream, glabrous outside, densely pubescent inside; lobes triangular, valvate in bud, with recurved edges and revolute tip, 5–6 × 2–3 mm, glabrous outside, densely pubescent inside with a glabrous tip ca 1.5 mm long. Corona staminal 2–2.5 mm high, 2.8–3.2 mm in diameter, red; lobes ca 2.2 × 0.8 mm, attached at the back of the anthers, held at ca 60° angle, ovoid, slightly carinate

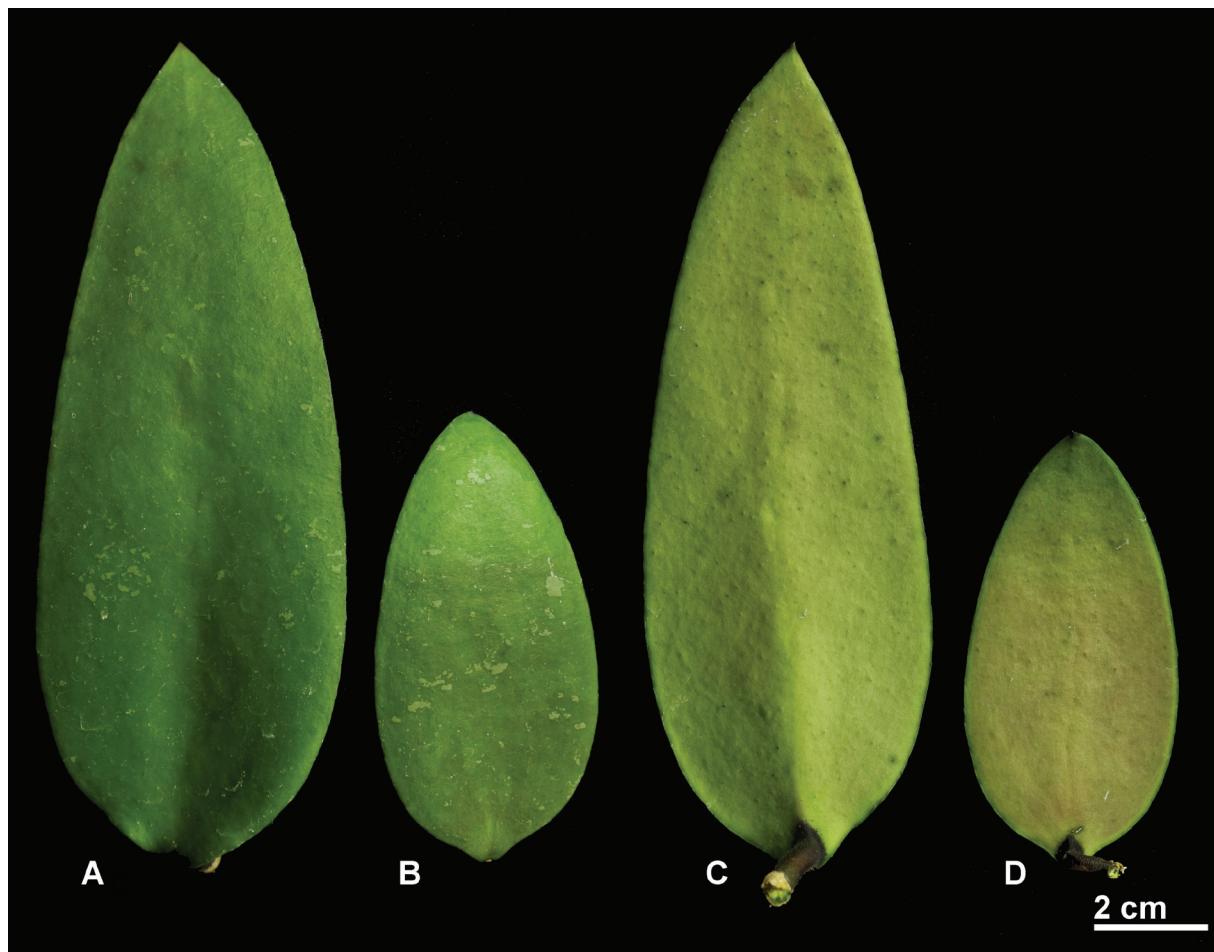

Fig. 4. *Hoya sumatrana* S.Rahayu & Rodda sp. nov. **A–B.** Leaves from above. **C–D.** Leaves from underneath. Photos: M. Rodda.

above, inner process bilobed, outer process rounded, with a narrow basal revolute margin. Anthers ca 0.5×0.4 mm, ovate, with a linear apical round membranaceous appendage to 2.8 mm long. Pollinia $280\text{--}320 \times 100\text{--}120$ μm , oblong, with a round base and obliquely truncate; pellucid margin all along the outer edge; caudicles $100\text{--}120 \times 70$ μm , broad, almost transparent; corpusculum $90\text{--}110 \times 40\text{--}60$ μm , oblong; style-head 5-angled in cross section, with five spreading lobes alternating with the stamens, style-head apex 0.8–0.9 mm long, 0.4–0.5 mm broad at the base, conical, with apex acute; ovary $1.5\text{--}2 \times$ ca 0.5 mm at the base, conical, with apex acute. Fruit and seed not observed.

Distribution and habitat

Hoya sumatrana sp. nov. is only known from the type locality in Lampung, Sumatra, Indonesia. It was collected in a coastal swamp forest, where it was growing as an epiphyte.

Conservation status

Known only from a single collection and lacking information on the distribution area, the population size and the possible threats to the habitat, *H. sumatrana* sp. nov. is considered as Data Deficient (DD) (IUCN 2012).

Notes

Hoya sumatrana sp. nov. is a new species in *H. sect. Peltostemma* Schlechter (1916: 14), characterized by upright corona lobes, long linear anther appendages extending well above the style-head and pollinaria with well developed caudicle wings. This section includes six species, two of which, *H. soidaoensis* Kidyoo (2013) and *H. phuwuaensis* Kidyoo (2016), have been recently published. *Hoya sumatrana* sp. nov. can be separated from all other members of this section because its flowers are much smaller; for example, the corolla of *H. sumatrana* sp. nov. is 7–9 mm in diameter, while the corolla of the second smallest species, *H. flagellata* Kerr (1940: tab. 3407), is > 10 mm in diameter, as well as the corona of *Hoya sumatrana* sp. nov. is 2.8–3.2 mm in diameter, while that of *H. flagellata* is > 4 mm in diameter. Another useful character to separate *H. sumatrana* sp. nov. from all other members of the section is the inner corona lobe process, that is bilobed in *H. sumatrana* sp. nov., while the other species have acute or rounded processes.

Discussion

Since Rahayu & Wanntorp (2012), the Sumatran specimens identified as *H. erythrostemma* Kerr (1939) have been identified as *H. rintzii*, *H. micrantha* Hook.f. (Hooker 1883) has been re-determined as *H. rundumensis*, and *H. verticillata* was reported as *H. parasitica* Wall. ex Wight (1834). Nine species have been added to the inventory of Sumatran *Hoya* (Rahayu & Wanntorp 2012), all described based on Sumatran collections. These are *H. andalensis*, *H. beccarii*, *H. brooksii*, *H. deykeae*, *H. omlorii*, *H. parvifolia*, *H. purpurascens*, *H. sarcophylla*, and *H. uncinata*.

Hoya variifolia is considered a new synonym of *H. parviflora*. Two further species, *H. glabra* Schltr (Schlechter 1908) and *H. kastbergii*, are newly recorded.

The total count of taxa of *Hoya* known from Sumatra now stands at 43 and includes 41 species and two subspecies.

Acknowledgments

We thank the directors and curators of the B, BO, BM, K, and SING herbaria for loans of specimens and access to the material studied. The National Parks Board Singapore is acknowledged for supporting numerous study trips to herbaria in SE Asia and Europe (MR). We are very grateful to Amar Husein Sitompul and Fadly for collecting some of the specimens cited in the paper, and to Dr. Frederik Leliaert, Dr. Koen Martens and Dr. Alejandro Quintanar for their editorial work on the paper.
