#### Abstract

In this work we shall introduce the concept of weakly quasi-prime modules and give some properties of this type of modules.

Key words: Prime module, quasi-p rime module, weakly quasi-prime module.

## 1- Introduction

Let R be a commutative ring with unity, and let M be an R -module, we introduce that an R-module M is called weakly quasi-prime module if $\operatorname{ann}_{R} \mathrm{M}=\operatorname{ann}_{R} r \mathrm{M}$ for every $r \notin \operatorname{ann}_{R} \mathrm{M}$, where $\operatorname{ann}_{\mathrm{R}} \mathrm{M}=\{r: r \in \mathrm{R}$ and $r \mathrm{M}=0\}$.

The main purpose of this work is to investigate the properties of weakly quasi-prime modules, and we give several characterizations of weakly quasi-prime modules. Recall that an R -module is called prime if $\operatorname{ann}_{\mathrm{R}} \mathrm{M}=\operatorname{ann}_{\mathrm{R}} \mathrm{N}$ for every non-zero submodule N of M and $\operatorname{ann}_{\mathrm{R}} \mathrm{M}=\{r: r \in \mathrm{R}$ and $r \mathrm{M}=0\},[1]$.
A submodule N of M is said to be prime if $a m \in \mathrm{~N}$ for $a \in \mathrm{R}, m \in \mathrm{M}$, then either $m \in \mathrm{~N}$ or $a \in[\mathrm{~N}: \mathrm{M}]$ where $[\mathrm{N}: \mathrm{M}]=\{r: r \in \mathrm{R}, r \mathrm{M} \subseteq \mathrm{N}\},[1]$, [2].
It was shown that in [1] M is prime module iff ( 0 ) is prime submodule.
The concept of quasi-prime module is introduced in [3] where an R-module M is quasi-prime module if $\operatorname{ann}_{R} \mathrm{~N}$ is prime ideal for every nonzero submodule N of M . If M is quasi-prime module then $\operatorname{ann}_{R} \mathrm{M}=\mathrm{ann}_{\mathrm{R}} r \mathrm{M} \forall r \notin \mathrm{ann}_{\mathrm{R}} \mathrm{M}$, [3]. But the converse is not true for example:

Let $\mathrm{M}=Z_{p^{\infty}}$ as Z -module is not quasi-prime module since if $\mathrm{N}=<1 / p^{2}+z>\leq Z_{p^{\infty}}$. So $\operatorname{ann}_{R} \mathrm{~N}=p^{2} z$ is not prime ideal in $Z$.
But ann $Z_{p^{\infty}}=0$ and $\forall r \neq 0$, let $a \in \operatorname{ann} r Z_{p^{\infty}}$ so $a r Z_{p^{\infty}}=0$, so $a r \in \operatorname{ann} Z_{p^{\infty}}$
ar $r=0$, but $r \neq 0$ so $a=0$ so ann $r Z_{p^{\infty}}=0$. Then ann $Z_{p^{\infty}}=\operatorname{ann} r Z$

## 2- Weakly Quasi-Prime Module

In this section we introduce the concept of weakly quasi-prime module and give several results about it.

### 2.1 Definition:

An R-module M is called weakly quasi-prime module (briefly W.q.p) if $\mathrm{ann}_{\mathrm{R}} \mathrm{M}=\mathrm{ann}_{\mathrm{R}} r \mathrm{M}$ for every $r \notin \mathrm{ann}{ }_{\mathrm{R}} \mathrm{M}$.

Recall that if R is an integral domain, an R -module M is said to be divisible iff $r \mathrm{M}=\mathrm{M}$ for every nonzero element $r$ in R, [4,p.35].
2.2 Examples and Remarks:

1. If $M$ is divisible over integral domain then $M$ is W.q.p.
2. Every quasi-prime is W.q.p but the converse is not true (see the example in the introduction).
3. Z as Z -module is W.q.p module since $\mathrm{ann}_{\mathrm{R}} \mathrm{Z}=0=\mathrm{ann}_{\mathrm{R}} r \mathrm{Z}, \forall \mathrm{r} \notin \mathrm{ann}_{\mathrm{R}} \mathrm{Z}$.
4. $\mathrm{Z}_{4}$ as Z -module is not W.q.p module Since $\mathrm{ann}_{\mathrm{R}} \mathrm{Z}_{4}=4 \mathrm{Z}$ and $\mathrm{ann}_{\mathrm{R}} 2 \mathrm{Z}=\operatorname{ann}_{\mathrm{R}}(\overline{2})=2 \mathrm{Z}$. Thus $\mathrm{Z}_{4}$ as Z -module is not W.q.p module.
5. $\mathrm{Z}_{6}$ as Z -module is not W.q.p module since $\operatorname{ann~}_{6}=6 \mathrm{Z}$ and $\operatorname{ann} 2 \mathrm{Z}_{6}=\operatorname{ann}(\overline{2})=3 \mathrm{Z}$, so $\mathrm{annZ}_{6} \neq$ ann $2 \mathrm{Z}_{6}$.
6. $\mathrm{Z}_{n}$ as Z -module is W.q.p module iff $n$ is prime.
7. Let $\mathrm{M}=\mathrm{Z} \oplus \mathrm{Z}_{p} ; p$ is prime number is $\mathrm{W} . \mathrm{q} . \mathrm{p}$ module since annM $=$ ann $r \mathrm{M}=0$ for each $r \notin \operatorname{ann}\left(\mathrm{Z} \oplus \mathrm{Z}_{p}\right)$.
8. $Z_{p^{\infty}}$ is W.q.p module since ann $Z_{p^{\infty}}=\operatorname{ann} r Z_{p^{\infty}}=0$.

### 2.3 Note:

Let M be W.q.p over integral domain in R. Then every divisible submodule of W.q.p module. Recall that a proper submodule N of M is called semi-prime submodule if every $r \in$ $\mathrm{R}, x \in \mathrm{M}, k \in \mathrm{Z}_{+}$, such that $r^{k} x \in \mathrm{~N}$, then $r x \in \mathrm{~N},[4, \mathrm{p} .50]$.

### 2.4 Proposition:

Let $M$ be divisible and ( 0 ) submodule of $M$ is semi-prime submodule, then the following statements are equivalent

1. M is prime module,
2. $M$ is q.p module,
3. M is W.q.p module.

Proof :(1) $\rightarrow$ (2), by [2,p10]
(2) $\rightarrow$ (3), by [2,p20]
(3) $\rightarrow$ (1) To prove M is prime module, i.e. to show that ( 0 ) is prime submodule.

Let $r m=0, r \in \mathrm{R}, m \in \mathrm{M}$, to prove either $m=0$ or $r \in \operatorname{ann}_{\mathrm{R}} \mathrm{M}$. Suppose $r \notin \mathrm{ann}_{\mathrm{R}} \mathrm{M}$, so we must prove that $m=0$. Since $r \notin \mathrm{ann}_{\mathrm{R}} \mathrm{M}, r \mathrm{M} \neq 0$. Hence $r \mathrm{M}=\mathrm{M}$, because M is divisible. Thus $m=r m_{1}$ for some $m_{1} \in \mathrm{M}$. Since $r m=r\left(r m_{1}\right)=0$, that is $r^{2} m_{1}=0$ which implies that $r m_{1}=0$, since ( 0 ) submodule of M is semi-prime. Thus $m=0$.

### 2.5 Remark:

The condition in proposition 2.4 is necessary as the following example shows:
$Z_{p^{\infty}}$ is not q.p since if $\mathrm{N}=\frac{1}{p^{2}}+\mathrm{Z}$ then ann $\mathrm{N}=p^{2} \mathrm{Z}$ is not prime ideal, but $Z_{p^{\infty}}$ is W.q.p module (see the example in the introduction).

### 2.6 Theorem:

Let M be a module over an integral domain R and every submodule of M is divisible then ann $(r m)=$ ann $(m)$, for each $r \notin$ ann $(m)$.
Proof: Since $(r m) \subseteq(m)$, so
$\operatorname{ann}(m) \subseteq \operatorname{ann}(r m)$
To prove ann $(r m) \subseteq$ ann $(m)$
Let $x \in$ ann $(r m)$ so $x(r m)=0$. Since every submodule of M is divisible, $(r m)=(m)$ and so $x m=0$ which implies $x \in$ ann ( $m$ ). Thus
$\operatorname{ann}(r m) \subseteq \operatorname{ann}(m)$
From (1) and (2), we have ann $(m)=\operatorname{ann}(r m)$, for each $r \notin$ ann $(m)$.
Recall that an R -module M is called multiplication R -module if for every submodule N of M , there exists an ideal I of R such that $\mathrm{IM}=\mathrm{N}$.

### 2.7 Theorem:

Let M be multiplication W.q.p R-module. Then every submodule of M is W ,.q.p module. Proof: Let N be submodule of M , since M is multiplication R -module, so $\mathrm{N}=\mathrm{IM}$; I be ideal of ring R. To prove N is W.q.p module.
To prove $\operatorname{ann}_{R} \mathrm{~N}=\operatorname{ann}_{\mathrm{R}} r \mathrm{~N}, \forall \mathrm{r} \notin \mathrm{ann}_{\mathrm{R}} \mathrm{N}$ since $r \mathrm{~N} \subseteq \mathrm{~N}$ so
$\mathrm{ann}_{R} \mathrm{~N} \subseteq \mathrm{ann}_{\mathrm{R}} r \mathrm{~N}$
To prove $\operatorname{ann}_{R} r \mathrm{~N} \subseteq \operatorname{ann}_{\mathrm{R}} \mathrm{N}$. Let $x \in \operatorname{ann}_{R} r \mathrm{~N}$ so $x r \mathrm{~N}=0$. Since M is multiplication so there exists an ideal I of R such that $\mathrm{N}=\mathrm{IM}$. Thus $x r \mathrm{IM}=0$; that is $x \mathrm{I} \subseteq \mathrm{ann}_{\mathrm{R}} r \mathrm{M}=\operatorname{ann}_{\mathrm{R}} \mathrm{M}$, hence $x \mathrm{IM}=0$; so $x \mathrm{~N}=0$ which implies $x \in \operatorname{ann}_{\mathrm{R}} \mathrm{N}$. Thus
$\mathrm{ann}_{\mathrm{R}} r \mathrm{~N} \subseteq \mathrm{ann}_{\mathrm{R}} \mathrm{N}$
From (1) and (2) we have $a n_{R} \mathrm{~N}=\mathrm{ann}_{\mathrm{R}} r \mathrm{~N}$ so N is W.q.p module.

### 2.8 Prop osition:

Let M be cy clic W.q.p R-module. Then M is q.p module.
Proof: Let M be cyclic so there exist $x \in \mathrm{M} ; \mathrm{M}=(x)$, let $y \in \mathrm{M}$, to prove $\mathrm{ann}_{\mathrm{R}} y$ is prime ideal, so $y=r x ; r \in \mathrm{R}$, let $a, b \in \operatorname{ann}_{\mathrm{R}} y$, to prove either $a \in \operatorname{ann}_{\mathrm{R}} \mathrm{y}$ or $b \in \mathrm{ann}_{\mathrm{R}} y$. Since $\quad a b \in$ $\operatorname{ann}_{\mathrm{R}} y=\operatorname{ann}_{\mathrm{R}} r x$, so $a b r x=0$. Suppose $b \notin \operatorname{ann}_{\mathrm{R}} y=\operatorname{ann}_{\mathrm{R}} r x$, i.e $b r x \neq 0$, so $a b \in \operatorname{ann}_{\mathrm{R}}(r x)=\operatorname{ann}_{\mathrm{R}}(x)$, since M is W.q.p module, so $a b x=0$ which implies that $a \in \operatorname{ann}_{\mathrm{R}} \mathrm{bx}=$ $\operatorname{ann}_{\mathrm{R}}(x)$ (since M is W.q.p). Thus $a x=0$ which implies $r a x=r .0=0$ so $a \in \operatorname{ann}(r x)$ which means $a \in \operatorname{ann}_{\mathrm{R}} y$.
2.9 Theorem:

Let $M$ be cy clic $R$-module then the following statements are equivalent

1. M is prime module
2. $a n n_{R} M=a n n_{R} I M ; I \nsubseteq a n n_{R} N$
3. M is W.q.p module.

Proof: To prove (1) $\rightarrow$ (2)
It is clear by definition of prime submodules.
(2) $\rightarrow$ (3) it is obvious.

To prove (3) $\rightarrow$ (1), to prove M is prime module.
By proposition (2.8) we have $M$ is q.p module which implies that $a n_{R} M$ is prime ideal, see [3,p.14] and by [3,p.8] we get $M$ is a prime module.

### 2.10 Theorem:

The direct sum of two W.q.p R-module is also W.q.p R-module.
Proof: Let $\mathrm{M}=\mathrm{M}_{1} \oplus \mathrm{M}_{2}$ where $\mathrm{M}_{1}$ and $\mathrm{M}_{2}$ are two W.q.p module, to prove M is W.q.p module, i.e to prove $\operatorname{ann}_{R} \mathrm{M}=\mathrm{ann}_{R} r \mathrm{M}$, for all $r \notin \mathrm{ann}_{R} \mathrm{M}$.

$$
\begin{aligned}
\operatorname{ann}_{\mathrm{R}} r \mathrm{M} & =\operatorname{ann}_{\mathrm{R}} r\left(\mathrm{M}_{1} \oplus \mathrm{M}_{2}\right) & & \\
& \left.=\operatorname{ann}_{\mathrm{R}} r \mathrm{M}_{1} \oplus r \mathrm{M}_{2}\right) & & \text {, see [2, p.80] } \\
& =\operatorname{ann}_{\mathrm{R}} r \mathrm{M}_{1} \cap \operatorname{ann}_{\mathrm{R}} r \mathrm{M}_{2} & & \text {, see [2, p.83] } \\
& =\operatorname{ann}_{\mathrm{R}} \mathrm{M}_{1} \cap \operatorname{ann}_{\mathrm{R}} \mathrm{M}_{2} & & \text {, since } \mathrm{M}_{1} \text { and } \mathrm{M}_{2} \text { are W.q.p } \\
& =\operatorname{ann}_{\mathrm{R}}\left(\mathrm{M}_{1} \oplus \mathrm{M}_{2}\right) & & \\
& =\operatorname{ann}_{\mathrm{R}} \mathrm{M} & &
\end{aligned}
$$

### 2.11 Corollary:

Let M be an R -module if M is $\mathrm{W} . \mathrm{q} . \mathrm{p}$ module then for any positive integer $n$, $\mathrm{M}^{n}$ is W.q.p module where $\mathrm{M}^{n}$ is the direct sum of $n$ copies of M .
2.12 Remark:

| Ibn Al-Hai tham Journal for Pure and Applied Sce |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| No. | 1 | Vol. | 25 | Year | 2012 |

A direct summand of W.q.p module is need not be W.q.p module.
For example: Let $\mathrm{M}=\mathrm{Z} \oplus \mathrm{Z}_{4}$ so $\mathrm{ann}_{\mathrm{R}} \mathrm{M}=\operatorname{ann}_{\mathrm{R}} r \mathrm{M} \forall r \notin \operatorname{ann}_{\mathrm{R}} \mathrm{M}$. But $\mathrm{Z}_{4}$ is not W.q.p module, (see remarks and examples (2.2(4)).

### 2.13 Theorem:

Let $\mathrm{M}_{1} ; \mathrm{M}_{2}$ then $\mathrm{M}_{1}$ is W.q.p iff $\mathrm{M}_{2}$ is W.q.p.
Proof: $\Rightarrow$ Let $\mathrm{f}: \mathrm{M}_{1} \rightarrow \mathrm{M}_{2}$ be 1-1 and onto and homomorphisim and $\mathrm{M}_{2}$ is W.q.p. To prove $\mathrm{M}_{1}=\mathrm{f}^{-1}\left(\mathrm{M}_{2}\right)$ is W.q.p module, that is to prove $\operatorname{ann}_{\mathrm{R}} \mathrm{f}^{-1}\left(\mathrm{M}_{2}\right) \subseteq \operatorname{ann}_{\mathrm{R}} \mathrm{f}^{-1}\left(\mathrm{M}_{2}\right) ; r \notin \operatorname{ann}_{\mathrm{R}} \mathrm{f}^{-1}\left(\mathrm{M}_{2}\right)$, let $x \in \operatorname{ann}_{\mathrm{R}} r \mathrm{f}^{-1}\left(\mathrm{M}_{2}\right)$ so $x r \mathrm{f}^{-1}\left(\mathrm{M}_{2}\right)=0$ and since $\mathrm{f}^{-1}$ is homomorphisim so $\mathrm{f}^{-1}\left(x r \mathrm{M}_{2}\right)=\mathrm{f}^{-1}(0)$ and since $\mathrm{f}^{-1}$ is $1-1$ so $x r \mathrm{M}_{2}=0$ which mean $x \in \mathrm{ann}_{\mathrm{R}} r \mathrm{M}_{2}$ but $\mathrm{M}_{2}$ is W.q.p module and $r \notin \operatorname{ann}_{\mathrm{R}} \mathrm{M}_{2}$ then $x \mathrm{M}_{2}=0$ which implies $\mathrm{f}^{-1}\left(x \mathrm{M}_{2}\right)=\mathrm{f}^{-1}(0)$, but $\mathrm{f}^{-1}$ is homomorphisim so $x \mathrm{f}^{-1}\left(\mathrm{M}_{2}\right)=0$ implies $x \in \operatorname{ann}_{\mathrm{R}} \mathrm{f}^{-1}\left(\mathrm{M}_{2}\right)$ so
$\mathrm{ann}_{\mathrm{R}} r \mathrm{f}^{-1}\left(\mathrm{M}_{2}\right) \subseteq \operatorname{ann}_{\mathrm{R}} \mathrm{f}^{-1}\left(\mathrm{M}_{2}\right)$
and since $r \mathrm{f}^{-1}\left(\mathrm{M}_{2}\right) \subseteq \mathrm{f}^{-1}\left(\mathrm{M}_{2}\right)$, so
$\mathrm{ann}_{\mathrm{R}} \mathrm{f}^{-1}\left(\mathrm{M}_{2}\right) \subseteq \operatorname{ann}_{\mathrm{R}} r \mathrm{f}^{-1}\left(\mathrm{M}_{2}\right)$
From (1) and (2) we have $\operatorname{ann}_{R} f^{-1}\left(M_{2}\right)=\operatorname{ann}_{R} r f^{-1}\left(M_{2}\right)$. So $f^{-1}\left(M_{2}\right)$ is W.q.p module.
$\Leftarrow$ clearly.

### 2.14 Note:

The condition "isomorphism" in theorem 2.13 is necessary as the following example shows
Example: Let $\pi: Z \longrightarrow \mathrm{Z} /(4) ; \mathrm{Z}_{4}$, where Z is $\mathrm{W} . \mathrm{q} . \mathrm{p}$, but $\mathrm{Z}_{4}$ is not W.q.p.

It is known that, if M is an R -module and I is an ideal of R which is contained in annRM then M is $\mathrm{R} / \mathrm{I}$-module, by taking $(r+1) x=r x \forall x \in \mathrm{M}, r \in \mathrm{R}$, see [5,p.40].

Now, we give the following result.

### 2.15 Theorem:

Let M be an R -module and let I be an ideal of R , which is contained in $a n n_{R} \mathrm{M}$. Then M is W.q.p R-module iff M is W.q.p R/I-module.
Proof: $\Rightarrow$ To prove $M$ is W.q.p R/I-module, i.e. to prove $\operatorname{ann}_{R I I} M=\operatorname{ann}_{R I}(r+1) M$. Since $(r+1) \mathrm{M} \subseteq \mathrm{M}$ so
$\mathrm{ann}_{\mathrm{RII}} \mathrm{M} \subseteq \operatorname{ann}_{\mathrm{RI}}(r+1) \mathrm{M}$
To prove ann $\mathrm{RII}(r+1) \mathrm{M} \subseteq \operatorname{ann}_{\mathrm{RII}} \mathrm{M}$
Let $x \in \operatorname{ann}_{R I}(r+1) \mathrm{M}$ so $x(r+1) \mathrm{M}=0$, which implies $(x r+1) \mathrm{M}=0$ so $(x r) \mathrm{M}=0$ (by definition), so $x \in \mathrm{ann}_{\mathrm{R}} \mathrm{rM}=\mathrm{ann}_{\mathrm{R}} \mathrm{M}$ (since M is W.q.p R-module).
$x \in \operatorname{ann}_{\text {RII }} \mathrm{M}$ (since $\mathrm{I} \subseteq \mathrm{ann}_{\text {RII }} \mathrm{M}$ ), so
$\mathrm{ann}_{\mathrm{RII}}(r+1) \mathrm{M} \subseteq \mathrm{ann}_{\mathrm{R} I} \mathrm{M}$
From (1) and (2) we have $\mathrm{ann}_{\text {RII }} \mathrm{M}=\operatorname{ann}_{\mathrm{RII}}(r+1) \mathrm{M}$.
$\Leftarrow$ If M is W.q.p $\mathrm{R} / \mathrm{I}$-module then M is W.q.p R-module, i.e. to prove $a \mathrm{an}_{\mathrm{R}} \mathrm{M}=a \mathrm{an}_{\mathrm{R}} r \mathrm{M}$, $\forall r \notin \mathrm{ann}_{R} \mathrm{M}$. Since $r \mathrm{M} \subseteq \mathrm{M}$ so
$\mathrm{ann}_{\mathrm{R}} \mathrm{M} \subseteq \mathrm{ann}_{\mathrm{R}} r \mathrm{M}$
To prove ann ${ }_{R} r \mathrm{M} \subseteq \operatorname{ann}_{R} \mathrm{M}$
Let $x \in \mathrm{ann}_{\mathrm{R}} r \mathrm{M}$ so $(x r) \mathrm{M}=0$ implies that $(x r+1) \mathrm{M}=0$, so $x(r+1) \mathrm{M}=0$, hence $x \in \operatorname{ann}_{\text {RII }}(r+1) \mathrm{M}=\operatorname{ann}_{\text {RII }} \mathrm{M}$ (since M is W.q.p R/I-module). Thus $x \in \operatorname{ann}_{\mathrm{RII}} \mathrm{M}$, which implies that $x \in \operatorname{ann}_{R} \mathrm{M}\left(\right.$ since $\left.\mathrm{I} \subseteq \operatorname{ann}_{R} \mathrm{M}\right)$, so
$\mathrm{ann}_{\mathrm{R}} r \mathrm{M} \subseteq \mathrm{ann}_{\mathrm{R}} \mathrm{M}$

From (1) and (2) we have $\mathrm{ann}_{\mathrm{R}} \mathrm{M}=\mathrm{ann}_{\mathrm{R}} r \mathrm{M}$.
So M is W.q.p module.
Recall that a subset S of a ring R is called multiplicatively closed if $1 \in \mathrm{~S}$ and $a \cdot b \in \mathrm{~S}$ for every $a, b \in \mathrm{~S}$. We know that every proper ideal P in R is prime if and only if $\mathrm{R}-\mathrm{P}$ is multiplicatively closed, see [4,p.42].

Let M be a module on the ring R and S be a multiplicatively closed on R such that $\mathrm{S} \neq 0$ and let $\mathrm{R}_{\mathrm{S}}$ be the set of all fractional $r / s$ where $r \in \mathrm{R}$ and $s \in \mathrm{~S}$ and $\mathrm{M}_{\mathrm{S}}$ be the set of all fractional $x / s$ where $x \in \mathrm{M}, s \in \mathrm{~S} ; x_{1} / s_{1}=x_{2} / s_{2}$ if and only if there exists $t \in \mathrm{~S}$ such that $t\left(s_{1} x_{2}-s_{2} x_{1}\right)=0$. So, can make $\mathrm{M}_{\mathrm{S}}$ into $\mathrm{R}_{\mathrm{S}}$-module by setting $x / s+y / t=(t x+s y) / s t$, $r / t \cdot x / s=r x / t s$ for every $x, y \in \mathrm{M}$ and for every $r \in \mathrm{R}, s, t \in \mathrm{~S}$. If $\mathrm{S}=\mathrm{R}-\mathrm{P}$ where P is a prime ideal we use $M_{P}$ instead of $M_{S}$ and $R_{P}$ instead of $R_{S}$. A ring in which there is only one maximal ideal is called local ring see [4,p.50], hence $R_{P}$ is often called the localization of $R$, similar $\mathrm{M}_{\mathrm{P}}$ is the localization of M at P . So we can define the two maps $\psi: \mathrm{R} \longrightarrow \mathrm{R}_{\mathrm{S}}$, such that $\psi(r)=r / 1, \forall r \in \mathrm{R}, \phi: \mathrm{M} \longrightarrow \mathrm{M}_{\mathrm{S}}$, such that $\phi(m)=m / 1, \forall m \in \mathrm{M}$, see [5,p.69]. Through this paper $\mathrm{S}^{-1} \mathrm{R}$ and $\mathrm{S}^{-1} \mathrm{M}$ represent $\mathrm{R}_{\mathrm{S}}$ and $\mathrm{M}_{\mathrm{S}}$ respectively.

### 2.16 Prop osition:

Let M be W.q.p R-module then $\mathrm{S}^{-1} \mathrm{M}$ is W.q.p $\mathrm{S}^{-1} \mathrm{R}$-module for each multiplicatively closed set $S$ of $R$.
Proof: To prove $\operatorname{ann}_{S_{R}}^{-1} \mathrm{~S}^{-1} \mathrm{M}=\operatorname{ann}_{\mathrm{S} R}^{-1} r / t \mathrm{~S}^{-1} \mathrm{M} \forall \frac{r}{t} \notin \operatorname{ann}_{\mathrm{S}_{\mathrm{R}}}^{-1} \mathrm{~S}^{-1} \mathrm{M}$, since $r / t \mathrm{~S}^{-1} \mathrm{M} \subseteq \mathrm{S}^{-1} \mathrm{M}$ so $\operatorname{ann}_{S_{R}}^{-1} \mathrm{~S}^{-1} \mathrm{M} \subseteq \operatorname{ann}_{S_{R}}^{-1} r / t \mathrm{~S}^{-1} \mathrm{M}$
To prove $\operatorname{ann}_{S_{R}}^{-1} r / t \mathrm{~S}^{-1} \mathrm{M} \subseteq \operatorname{ann}_{S_{\mathrm{R}}^{-1}} \mathrm{~S}^{-1} \mathrm{M}$
Let $y / t^{\prime} \in \operatorname{ann}_{S_{\mathrm{R}}}^{-1} r / t \mathrm{~S}^{-1} \mathrm{M}$ so $y / t^{\prime} \cdot r / t \mathrm{~S}^{-1} \mathrm{M}=0$ which implies that $y r / t t^{\prime} \mathrm{S}^{-1} \mathrm{M}=0$ where $y r \in \mathrm{M}, t t^{\prime} \in \mathrm{S}$ so $y r / t t^{\prime} \mathrm{S}^{-1} \mathrm{M}=0$ which implies that $y r / t t^{\prime} \mathrm{M} / \mathrm{S}=0$ so $y r \mathrm{M}=0$. Hence $y \in \mathrm{ann}_{\mathrm{R}} r \mathrm{M}=\mathrm{ann}_{\mathrm{R}} \mathrm{M}$.
Since $y \in \operatorname{ann}_{R} \mathrm{M}$ so $y \mathrm{M}=0$. Thus $y \mathrm{M} / t s=0$ so $y / t \cdot \mathrm{~S}^{-1} \mathrm{M}=0, y / t \cdot \in \operatorname{ann}_{R} \mathrm{~S}^{-1} \mathrm{M}$, hence $\operatorname{ann}_{S}^{-1} r / t \mathrm{~S}^{-1} \mathrm{M} \subseteq \operatorname{ann}_{S_{R}}^{-1} \mathrm{~S}^{-1} \mathrm{M}$
From (1) and (2) we have $\operatorname{ann}_{S_{R}}^{-1} S^{-1} \mathrm{M}=\operatorname{ann}_{S_{R}}^{-1} r / t \mathrm{~S}^{-1} \mathrm{M}$, so $\mathrm{S}^{-1} \mathrm{M}$ is W.q.p module.
