

# AN AMENDED CHECK-LIST OF THE BIRDS OF THE KRUGER NATIONAL PARK

By U. DE V. PIENAAR, Ph.D.

(Assistant Biologist, Skukuza, Kruger National Park.)

O. P. M. PROZESKY, B.Sc.

(Ornithologist, Transvaal Museum, Pretoria.)

The systematic survey of the bird-life in the Kruger National Park which was initiated during 1959 in collaboration with the Ranger section and Mr. O. Prozesky of the Transvaal Museum, has brought to attention many species that have not been included in the previous check-list of the late Col. Rowland-Jones, in which 276 species were listed.

In view of the large number of new records and the nomenclatural changes brought about by the adoption of Vincent's system of classification (as revised by McLachlan and Liversidge), it has become necessary to issue an amended check-list in which all supplementary data are incorporated.

In the new list all species are included which have been recorded to date by credible observers. Species marked with an \* indicate new records for the Park. The name Rudebeck and Rowland-Jones after a specific name signifies that the occurrence of these species have been reported by the respective authority, but that such has not been confirmed as yet by the present survey. The number provided in brackets after the vernacular names are those of Roberts.

No distribution records are provided at this stage considering the incomplete nature of our data in this respect.

Species marked with a double asterisk require further confirmation.

A total of 412 species is recorded in this check-list.
