#### Abstract

The Hurwitz space $\mathcal{H}_{\mathrm{r}}^{\text {in }}(\mathrm{G})$ is the space of genus $\mathrm{g}=0$ covers of the Riemann sphere $\mathbb{P}^{1}$ with r branch points and the monodromy group $G$. Let $G$ be the symmetric group $S_{7}$. In this paper, we enumerate the connected components of $\mathcal{H}_{\mathrm{r}}^{\mathrm{in}}\left(\mathrm{S}_{7}\right)$. Our approach uses computational tools, relying on the computer algebra system GAP and the MAPCLASS package, to find the connected components of $\mathcal{H}_{\mathrm{r}}^{\mathrm{in}}\left(\mathrm{S}_{7}\right)$. This work gives us the complete classification of primitive genus zero symmetric group of degree seven.

Keywords: Monodromy Groups; Braid Orbits; Connected Components.

## 1. Introduction

Let us start this section by the following definition:
A primitive genus $g$ system is a triple $\left(G, \Omega,\left(x_{1}, \ldots, x_{r}\right)\right)$ where $\Omega$ is a finite set of size $n$ and $G$ is a primitive subgroup of $S_{n}$ such that

$$
\begin{gather*}
G=<x_{1}, \ldots, x_{r}>  \tag{1}\\
\prod_{i=1}^{r} x_{i}=1  \tag{2}\\
2(n+g-1)=\sum_{i=1}^{r} \text { ind } x_{i} \tag{3}
\end{gather*}
$$

where $x_{i} \in G \backslash\{1\}$. For $x \in G$ define ind $x=n-\operatorname{orb}(x)$, Fix $x=\{w \in \Omega \mid x w=w\}, f(x)=\mid$ Fix $x \mid$ and $\operatorname{orb}(x)=$ $\frac{1}{d} \sum_{i=0}^{d-1} f\left(x^{i}\right)$, where $d$ is the order of $x$ in $S_{n}$. These conditions (1), (2) and (3) are equivalent to the existence of the branched cover $\mu: X \rightarrow \mathbb{P}^{1}$, where $X$ is a Riemann surface of genus $g$. The number of holes is called the genus, and $\mu$ is a meromorphic function where $\mathbb{P}^{1}=\mathbb{C U}\{\infty\}$ is the Riemann sphere.

Let $C_{i}$ be a non-trivial conjugacy class of $x_{i}$. Then the set $C=\left\{C_{1}, \ldots, C_{r}\right\}$ in $G$ is called the ramification type of the cover $\mu$. Note that the trivial conjugacy class contains only the identity element.

In this paper, we classify primitive genus 0 systems for $S_{7}$. It is clear that there are seven primitive groups of degree 7. In [1], we classified all those groups except $S_{7}$. Now we are going to classify the group $S_{7}$ by using the computer algebra system GAP. All together give the complete classification of primitive genus 0 groups of degree 7 .

Braid orbits can be interpreted as saying interesting things about components of the moduli space of curves $\mathcal{M}_{g}$ [3] and equivalence classes of branched covers of the Riemann sphere $\mathbb{P}^{1}$.

The full details of the following results and concepts can be found in [1-11].
Let $C_{1}, \ldots, C_{r}$ be non-trivial conjugacy classes of a finite group $G$. The set of generating systems $\left(x_{1}, \ldots, x_{r}\right)$ of $G$ with $x_{1} \ldots x_{r}=1$ and such that there is a permutation $\pi \in S_{r}$ with $x_{i} \in S_{\pi(i)}$ for $i=1, \ldots, r$ is called a Nielsen class and denoted by $\mathcal{N}(\mathrm{C})$, where $C=\left(C_{1}, \ldots, C_{r}\right)$.
Each Nielsen class is the disjoint union of braid orbits, which are defined as the smallest subsets of the Nielsen class closed under the braid operations

$$
\begin{equation*}
\left(x_{1}, \ldots, x_{r}\right)^{Q_{i}}=\left(x_{1}, \ldots, x_{i+1}, x_{i+1}^{-1} x_{i} x_{i+1}, \ldots, x_{r}\right) \tag{4}
\end{equation*}
$$

for $i=1, \ldots, r$.
We denote by $\mathrm{O}_{\mathrm{r}}$, the space of subsets of $\mathbb{C}$ of cardinality r .
Definition 1.1 Let $B \in O_{r}$ and $b_{0} \in \mathbb{P}^{1} \backslash B$. We call a map $\varphi: \pi_{1}\left(\mathbb{P}^{1} \backslash B, b_{0}\right) \rightarrow G$ admissible if it is a surjective homomorphsim, and $\varphi\left(\theta_{b}\right) \neq 1$ for each $b \in B$. Here $\theta_{b}$ is the conjugacy class of $\pi_{1}\left(\mathbb{P}^{1} \backslash B, b_{0}\right)$.
Definition 1.2 Let $B \in O_{r}$ and $\varphi: \pi_{1}\left(\mathbb{P}^{1} \backslash B, \infty\right) \rightarrow G$ be admissible. Then we say that two pairs $(\mathrm{B}, \varphi)$ and $(\overline{\mathrm{B}}, \bar{\varphi})$ are A-equivalent if and only if $B=\bar{B}$ and $\bar{\varphi}=a \circ \varphi$ for some $a \in A$. Let $[B, \varphi]_{A}$ denote the A-equivalence class of $(B, \varphi)$. The set of equivalence classes $[B, \varphi]_{A}$ is denoted by $\mathcal{H}_{r}^{A}(G)$ and is called the Hurwitz space of $G$-covers.
Lemma 1.3 Let $C$ be a fixed ramifcation type in $G$, and the subset $\mathcal{H}_{r}^{\text {in }}(C)$ of $\mathcal{H}_{r}^{\text {in }}(G)$ consist of all $[B, \emptyset]_{A}$ with $B=\left\{b_{1}, \ldots, b_{r}\right\}, \emptyset: \pi_{1}\left(\mathbb{P}^{1} \backslash B, \infty\right) \rightarrow G$ and $\varnothing\left(\theta_{b_{i}}\right) \in C_{i}$ for $\mathrm{i}=1, \ldots, \mathrm{r}$. Then $\mathcal{H}_{r}^{A}(C)$ is a union of connected components in $\mathcal{H}_{\mathrm{r}}^{\mathrm{A}}(\mathrm{G})$. Under the bijection from Lemma 2.2, the fiber in $\mathcal{H}_{r}^{A}(C)$ over $\mathrm{B}_{0}$ corresponds the set $\mathcal{N}^{\mathrm{A}}(\mathrm{C})$. This yields a one to one correspondence between components of $\mathcal{H}_{r}^{A}(C)$ and the braid orbits on $\mathcal{N}^{A}(C)$. In particular, $\mathcal{H}_{r}^{\text {in }}(C)$ is connected if and only if there is only one braid orbit.
Proof. For a proof see [2].

## 2. Computing Indexes and Labeling Conjugacy Classes

In this paper, we discuss two methods for computing index as follows:

## Method one (Via Fixed Points)

Let G be a group acting on a finite set $\Omega$ of size $n$. If $x \in G$, define the index of x by ind $x=n-\operatorname{orb}(x)$ where $\operatorname{orb}(x)$ is the number of orbits of $\langle x\rangle$ on $\Omega$. Also Fix $x=\{\omega \in \Omega \mid x \omega=\omega\}, f(x)=\mid$ Fix $x \mid$. Furthermore, $\operatorname{orb}(x)=\frac{1}{d} \sum_{i=0}^{d-1} f\left(x^{i}\right)$ where x has order d.We discussed this method in detail in [2].

## Method two (Via Cycle Types)

As we know that ind $x_{i}$ is the minimal number of 2-cycles needed to express $x_{i}$ as a product. We will label the fourteen nontrivial conjugacy classes of $S_{7}$ as ATLAS notation by:

Table 1. Non trivial conjugacy classes of $\boldsymbol{S}_{\mathbf{7}}$.

| Type | Conjugacy class | Ind |
| :---: | :---: | :--- |
| 2A | $(1,2)^{S_{7}}$ | 1 |
| 2B | $(1,2)(3,4)^{S_{7}}$ | 2 |
| 2C | $(1,2)(3,4)(5,6)^{S_{7}}$ | 3 |
| 3A | $(1,2,3)^{S_{7}}$ | 2 |
| 3B | $(1,2,3)(4,5,6)^{S_{7}}$ | 4 |
| 4A | $(1,2,3,4)^{S_{7}}$ | 3 |
| 4B | $(1,2,3,4)(5,6)^{S_{7}}$ | 4 |
| 5A | $(1,2,3,4,5)^{S_{7}}$ | 4 |
| 6A | $(1,2,3)(4,5)(6,7)^{S_{7}}$ | 4 |
| 6B | $(1,2,3)(4,5)^{S_{7}}$ | 3 |
| 6C | $(1,2,3,4,5,6)^{S_{7}}$ | 5 |
| 7A | $(1,2,3,4,5,6,7)^{S_{7}}$ | 6 |
| 10A | $(1,2,3,4,5)(6,7)^{S_{7}}$ | 5 |
| 12A | $(1,2,3,4)(5,6,7)^{S_{7}}$ | 5 |

## CONNECTED COMPONENTS OF THE HURWITZ SPACE

## 3. Algorithm

To achieve connected components of $\mathcal{H}_{r}^{i n}(G)$, we need to perform the following steps:
Step 1: Select the primitive group $S_{7}$ by using the GAP code [7] : Primitive Group (7, 7).
Step 2: Find all ramification types that satisfy equation (3) for given $S_{7}$, degree 7 and genus 0 .
Step 3: Remove those types which have zero structure constant from the character table of $S_{7}$ via the following equation.

$$
\begin{equation*}
n\left(C_{1}, \ldots, C_{k}\right)=\frac{\left|C_{1}\right|\left|C_{2}\right| \ldots\left|C_{k}\right|}{|G|} \sum_{\chi \in \operatorname{Irr}(G)} \frac{\chi\left(x_{1}\right) \chi\left(x_{2}\right) \ldots \chi\left(x_{k}\right)}{\chi(1)^{k-2}} \tag{5}
\end{equation*}
$$

With equation (5), we compute the number of k-tuples $\left(x_{1}, \ldots, x_{k}\right)$ of elements $x_{i}$ in the conjugacy class $C_{i}$ of a group $S_{7}$ such that $x_{1} x_{2} \ldots x_{k}=1$. In other words, we remove those types which don't satisfy equation (2). Step 4: For the remaining types, that pass equation (1) which are called generating types.
Step 5: For the generating types, compute braid orbits by using MAPCLASS package.
Now we perform the above steps by using the program described in [12], but with a few modifications to it. That is, we remove the condition of affine type in that program. In this paper we only consider primitive groups.

## 4. Results

In this paper, we use the algorithm which is presented in section 3 to compute braid orbits on Nielsen class. An application of the algorithm is the classification of the primitive genus zero systems for $S_{7}$. That is, we find the connected components $\mathcal{H}_{r}^{\text {in }}(\mathrm{C})$ of $\mathrm{S}_{7}$-curves X, such that $\mathrm{g}\left(\mathrm{X} / \mathrm{S}_{-} 7\right)=0$. In our situation, the computation shows that there are exactly 1071 braid orbits of primitive genus 0 systems of degree 7 . The degree and the number of the branch points are given in Tables 2 and 3. The detail of the Table 1 exists in [10].

Table 2. Primitive Genus Zero Systems: Number of Components.

## Theorem 4.1

Up to isomorphism, there exist exactly 6 primitive genus zero groups of degree seven. The corresponding primitive genus zero groups are enumerated in Table 4 and Tables 2-3.

## Lemma 4.2

The Hurwitz spaces, $\mathcal{H}_{r}^{\text {in }}(C)$ are connected if $G=S_{7}$ and $r \geq 5$.
Proof. It follows from the fact that the Nielsen classes $\mathcal{N}(C)$ are the disjoint union of braid orbits but we have only one braid orbit for $S_{7}$ and $r \geq 5$. From Lemma 1.3, we obtain that the Hurwitz spaces $\mathcal{H}_{r}^{i n}(C)$ are connected.

## Lemma 4.3

The Hurwitz spaces, $\mathcal{H}_{r}^{\text {in }}(C)$ are disconnected if $G=S_{7}$ and $r \leq 4$.
Proof. Since we have at least two braid orbits for some type $C$ for $r \leq 4$ and $G=S_{7}$ and the Nielsen classes $\mathcal{N}(\mathrm{C})$ are the disjoint union of braid orbits. From Lemma 1.3, we obtain that the Hurwitz spaces $\mathcal{H}_{r}^{\text {in }}(C)$ are disconnected.

## CONNECTED COMPONENTS OF THE HURWITZ SPACE

Table 5. Primitive genus zero systems of $\boldsymbol{S}_{7}$.

## Conclusion

Here, we compute braid orbits on Nielsen class with the aid of the computer algebra system GAP and MAPCLASS package. A result of the algorithm is that it gives the complete classification of the symmetric group $S_{7}$ up to braid actions and diagonal conjugations. The computation shows that there are exactly 754 braid orbits of $\mathrm{S}_{7}$. As a consequence of Lemma 1.3, we find the connected components $\mathcal{H}_{r}^{\text {in }}\left(S_{7}\right)$ of $S_{7}$-curves $X$, such that $g=0$. So we have 754 connected components $\mathcal{H}_{r}^{\text {in }}\left(S_{7}\right)$ of the symmetric group of degree seven.

## Acknowledgments

The author would like thank the anonymous referees, whose comments and suggestions helped to improve the manuscript.
